

Taskaya

Flutter Task Manager - Phase 1 Report

TEAM MEMBERS

Ahmed Sameh • Mostafa Mohamed

APPLICATION DESCRIPTION

Taskaya is a minimal task-management app built with Flutter and Dart. It lets a user capture, organise and complete day-to-day tasks through a deliberately restrained black-and-white interface, with nothing competing visually with the content.

The app opens on an animated splash screen, then a welcome screen introducing the product, and into the main task list. Tasks are grouped into **Pending** and **Completed** sections and sorted automatically by priority and due date. Each task holds a title, optional description, a priority (High / Medium / Low) and an optional due date and time - and every card always shows a date, falling back to when it was added or completed if no due date is set. State is managed with **Provider** over a repository layer, and preferences such as the selected theme persist locally via **SharedPreferences**. The project passes `flutter analyze` with zero issues.

PHASE 1 REQUIREMENTS

Requirement	Status	Implementation
Splash Screen	Done	Animated logo and wordmark, auto-navigates after 1.1s
Home Screen	Done	Header with counts, sectioned list, empty state, floating action button
Display a list of tasks	Done	Pending / Completed sections, auto-sorted by priority then due date
Add a new task	Done	Full-screen form: title, description, priority, due date and time
Edit an existing task	Done	Tap a card, or long-press for the Edit action
Delete a task	Done	Swipe-to-delete or long-press menu, with confirmation and Undo
Mark Completed / Incomplete	Done	Animated checkbox; the card moves between sections instantly
Attractive, organised UI	Done	Monochrome design system: shared spacing, type and colour tokens
Proper navigation	Done	Custom fade and slide-up transitions between all screens

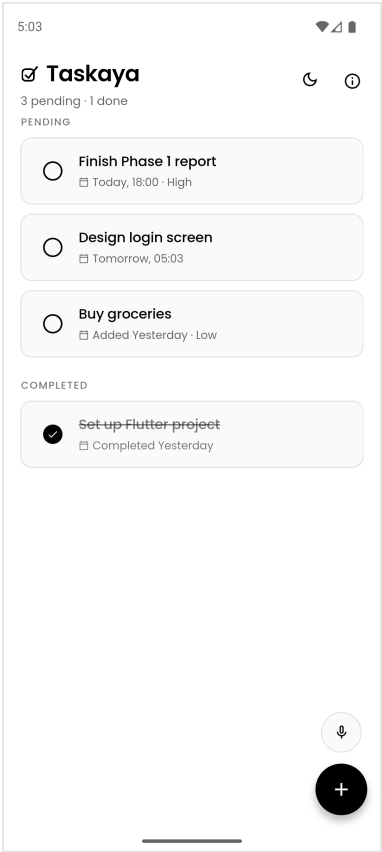

ADDITIONAL FEATURES

Dark mode - full light/dark theming with a header toggle, persisted between launches. **Animations** - screen transitions, staggered list entrance, animated checkbox, swipe-to-delete and a rotating theme-toggle icon. **Task reminders** - an in-app notification centre derives overdue, due-today and due-tomorrow reminders from due dates, with an unread badge and persisted read state. **Voice input** - microphone affordances appear in the UI as placeholders; speech recognition is deferred to Phase 2.

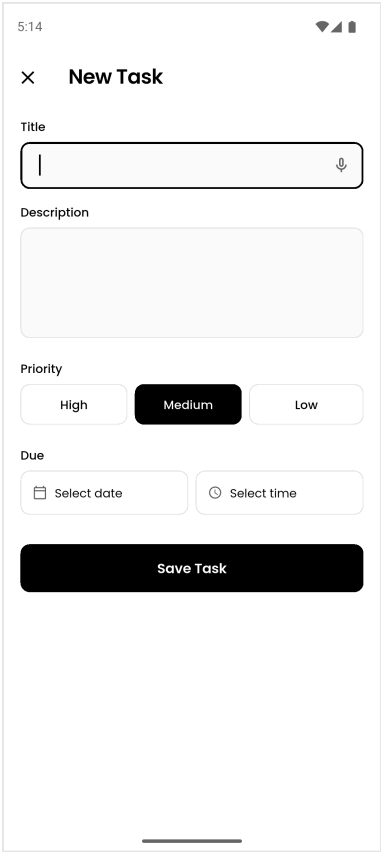

TEAM CONTRIBUTIONS

Area	Ahmed Sameh	Mostafa Mohamed
Screens (UI)	Signup screen; Home screen (header, task list, empty state, FAB); Add / Edit task screen	Splash screen (logo, app name, auto-navigation); Login screen (fields, buttons, error states)
Logic	Signup validation; task data model and full CRUD (add, edit, delete, toggle complete); state management binding the list to the UI	Login validation and local mock authentication; app navigation and routing setup across the screen flow
Testing	CRUD operations and form-validation edge cases, including empty titles and invalid signup input	Navigation flow across all screens; identified and fixed broken transitions

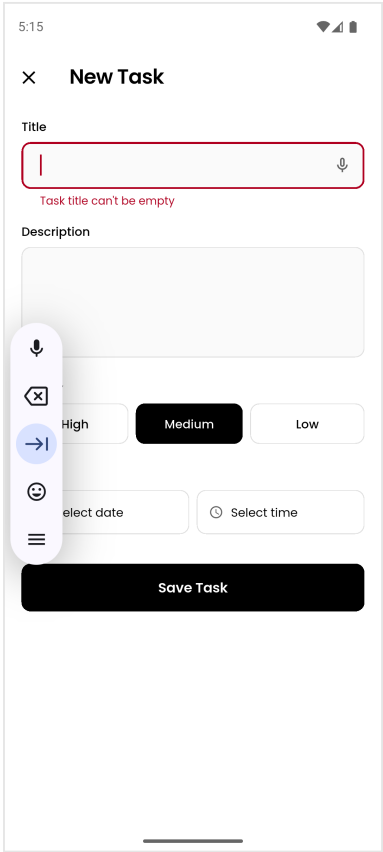

SCREENSHOTS

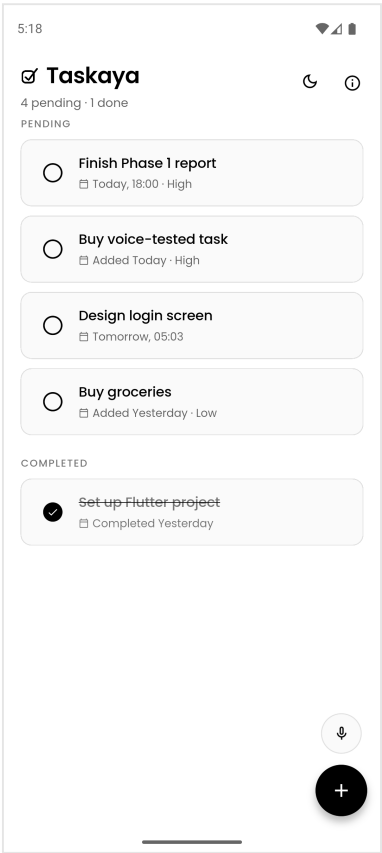

Home - task list

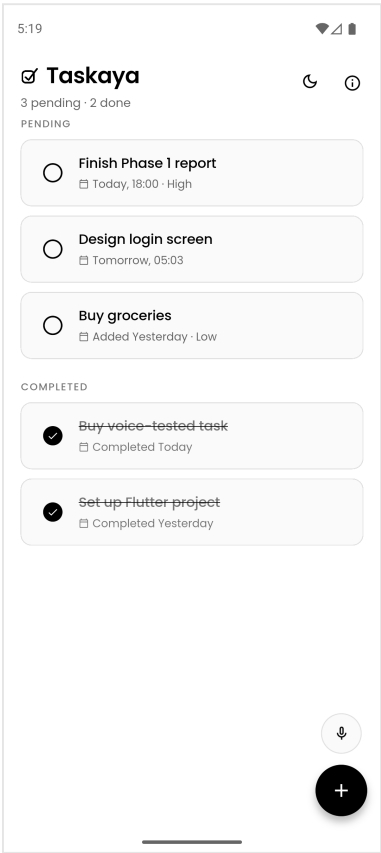

Add a new task

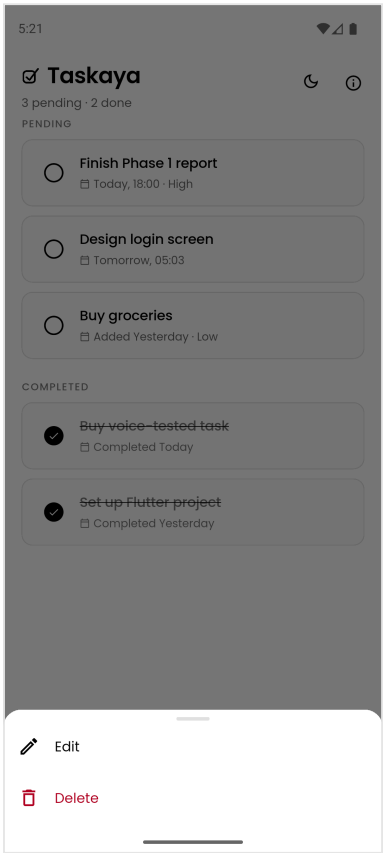

Form validation

Task added and sorted

Marked as completed

Edit / Delete actions

Captured from the app running on an Android emulator (Pixel 9a, Android 16).
